NESTING BIOGEOGRAPHY OF SEA TURTLES IN JAPAN

We are grateful to the Sea Turtle Association of Japan, which generously allowed us to re-create its map of 2016 sea turtle nesting in Japan for inclusion in this volume (pages 28–29). We are especially grateful to Yoshi Matsuzawa and Kei Okamoto for their assistance in sourcing data, translating, and developing the maps. Thank you.

NESTING BIOGEOGRAPHY OF SEA TURTLES IN THE FRENCH TERRITORIES

GUIDELINES OF DATA USE AND CITATION

The data that follow correspond directly to the map of sea turtle nesting in the French territories on pages 22–23. Every data record is numbered to correspond with its respective point on the map. To use data for research or publication, you must obtain permission from the data provider.

DEFINITIONS OF TERMS

Clutches: A count of the number of nests of eggs laid by females during the monitoring period. **Crawl:** A female turtle’s emergence onto the beach to nest. Such counts may include false crawls. **Nesting females:** A count of nesting female turtles observed during the monitoring period. **Year:** The year in which a given nesting season ended (e.g., data collected between late 2015 and early 2016 are listed as year 2016).

Nesting data reported here are for the most recent available nesting season. Beaches for which count data are not available are listed as “unquantified.” A reported count of “N/A” indicates no data were reported for that species at the respective site. Additional metadata are available for many of the data records and may be found online at http://seamap.env.duke.edu/swot.

Project Title: Adelita

Metadata: 1 *Caretta caretta*; tag deployed in Baja California, Mexico. This turtle, known

as “Adelita,” was the first loggerhead to be tracked crossing the Pacific Ocean; the tag was deployed on July 19, 1994, on the central Pacific coast of the Baja California peninsula and was recovered, dead in a set net, by a fisherman off the coast of Kyushu, Japan, 478 days later (November 9, 1995) after traveling 10,600 km.
